

## Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact [support@jstor.org](mailto:support@jstor.org).

**Oberholser on the Subspecies of Leach's Petrel.**<sup>1</sup>—No less than three petrels of this group have been described from the western coast of North America.—*Oceanodroma kaedingi*, *beali* and *beldingi*. Difference of opinion has prevailed as to their relationship to one another as well as to *O. leucorhoa*. After the study of a large series of specimens including the types of all the west coast forms, Mr. Oberholser comes to the conclusion that true *leucorhoa* is found in the North Pacific as well as in the Atlantic. That *O. beali* is recognizable as a smaller subspecies ranging from south-eastern Alaska to California and that *O. kaedingi* is a still better marked subspecies occurring off the coast of Lower California. *O. beldingi* he cannot separate from *beali*. It will be interesting to see whether his conclusions will be endorsed by others or whether a still different conclusion will be reached by the next student of the group. Certainly he has presented the most careful and detailed study that has yet been offered.—W. S.

**Oberholser on Birds from Islands in the Java and China Seas.**—The first of these papers<sup>2</sup> covers collections from four islands, Solombo Besar, Arends, Pulo, Mata Siri and Pulo Kalambau. Fourteen new forms are described as well as one new genus, *Perissolalage* (p. 182) type *P. chalepa* sp. nov., from Solombo Besar, based on a single female. Another more extended paper<sup>3</sup> treats of the birds of the Anamba Islands, fifty-six in number, of which nineteen are new subspecies here described for the first time. All the collections were made by Dr. W. L. Abbott.—W. S.

**Paxson on the Last of the Wild Pigeon in Bucks County, Pennsylvania.**<sup>4</sup>—Col. Paxson has spent much time in gathering the data contained in this interesting paper and is to be congratulated upon publishing it and thus placing it on permanent record. Upon glancing over the pages we realize what an amount of information can be gathered by interviewing old pigeon trappers and hunters, and are surprised that more intelligent research along these lines has not been conducted. Some of the information gathered in this manner is probably of no great value but much of it is extremely interesting and when we realize that not only is the last pigeon dead, but that every year the men who formerly hunted the bird are becoming fewer and fewer, we appreciate work of the sort that has resulted
